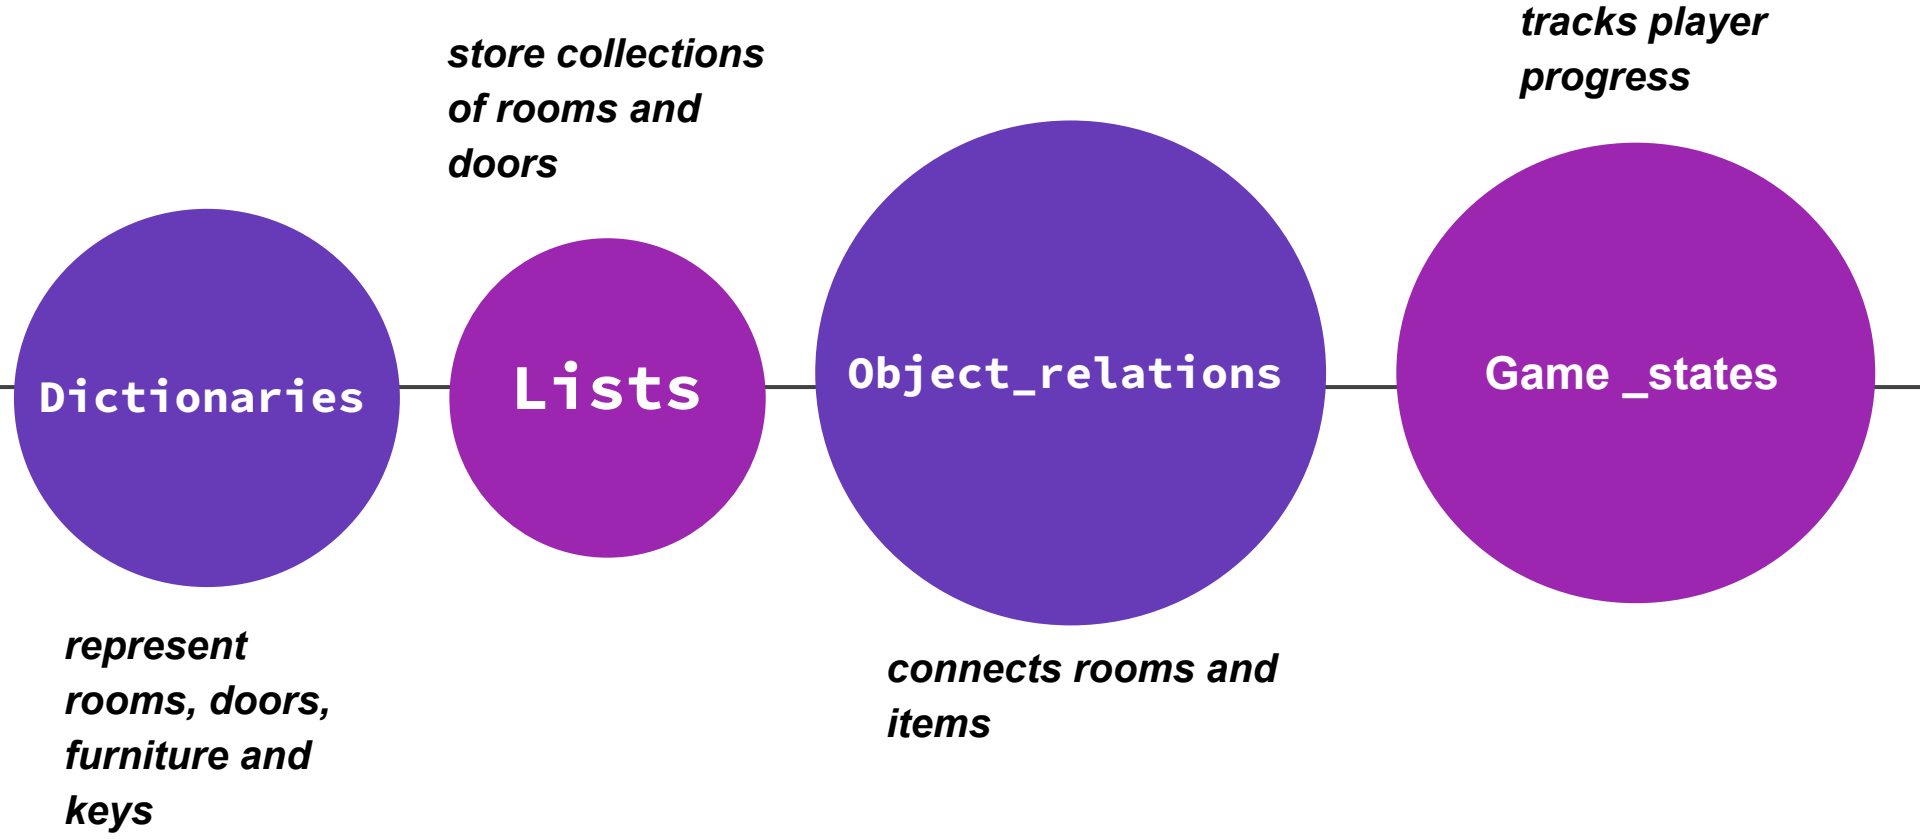
Game's Structure



Game's Functions

```
def line_break()
```

```
def play_room(room)
```

```
def get_next_room_of_door(door, current_room)
```

```
def start_game()
```

```
def explore_room(room)
```

```
def examine_item(item_name)
```

Additional Featur
Timer System

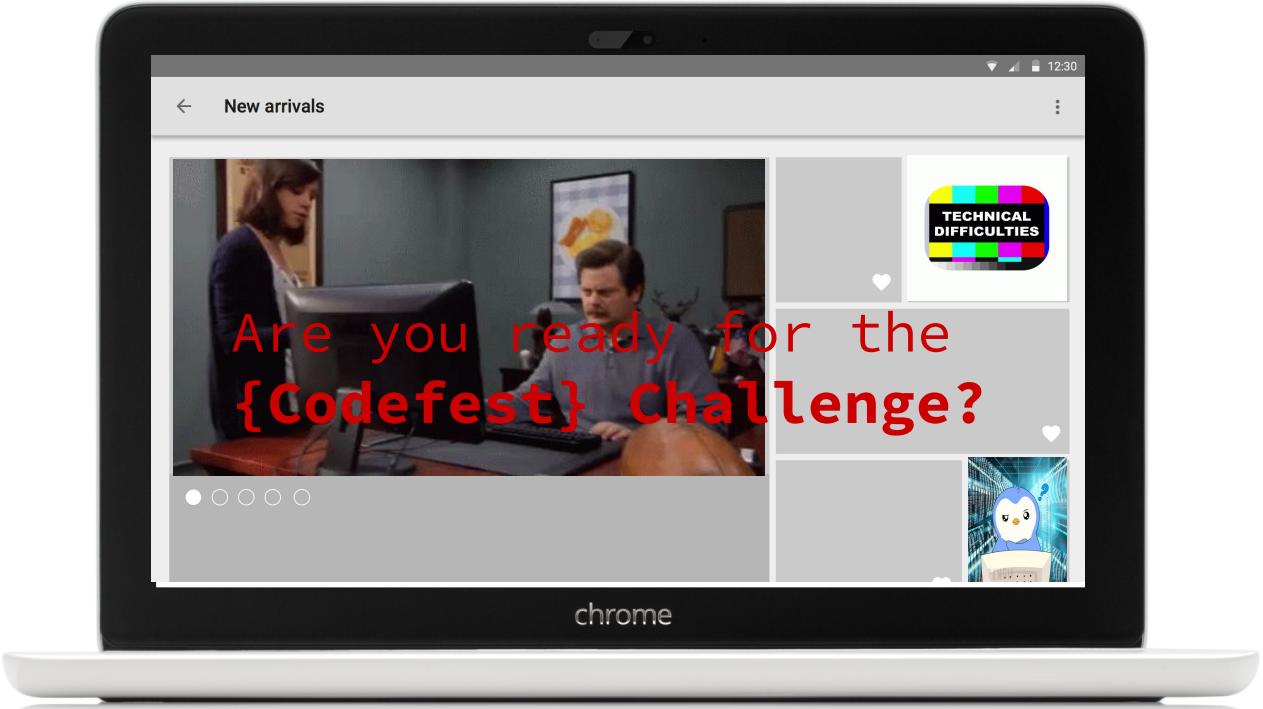
- Tracks elapsed time using Python's `time` module
- Calculates remaining time during each player action
- Ends the game if the player runs out of time

Technical Challenges We faced

-Creating object relations

-Adding timer function to our game

- Integrating a timer into the game without interrupting the game flow.



Overcoming challenges

Implement error handling techniques in Python to handle errors.

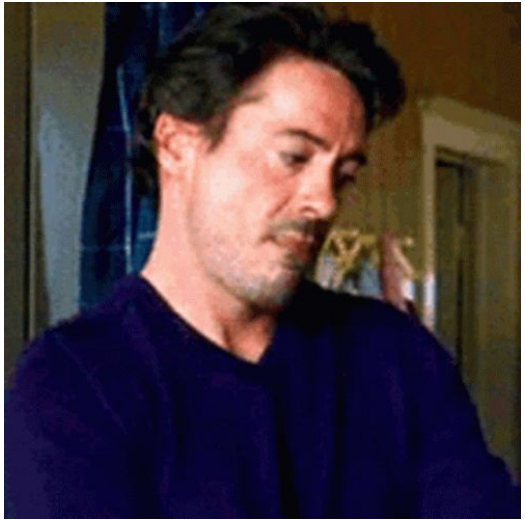
Problem:

The game relies on user input and multiple function calls.

Solution:

We used Python's **time module** to track elapsed time and calculate the remaining time during each player action.

We will be able to improve the robustness and reliability of the code by implementing appropriate error handling techniques.



Mistakes we made

- Editing codes and not saving it.
- Initially, we tried to implement the timer as a continuous countdown.

Lesson learned

- Remember to save all changings in the codes.
- How Python executes code sequentially.
- The importance of understanding program flow.
- How to use the time module effectively.

Demo

Let’s start Mission Possible
